which the model parameters are fixed or non-random quantities.

This is in contrast to random effects models and mixed models in which all or some of the model parameters are random variables.

In many applications including econometrics and biostatistics a fixed effects model refers to a regression model in which the group means are ...

of the regression methods means that models with more than a single QTL can be explored and we give examples of two lined loci and of two interacting loci. Other models, for example with more than two QTL, with environmental fixed effects, with between family variance or for threshold traits, could be fitted in a similar way.
