Therefore the turning point of the quadratic function $f(x) = a(x+p)^2 + q$ is $(-p; q)$. Alternative form for quadratic equations: We can also write the quadratic equation in the form $y = a(x - p)^2 + q$ The effect of (p) is still a horizontal shift, however notice that: For $(p > 0)$, the graph is shifted to the right by (p) units. For ...

This function is linear, not quadratic. What does this result indicate about the three points? The 3 points are on the same line, which means that you cannot write the equation of a quadratic function whose graph passes through the points. Lesson 10-3: Explain how to determine the zeros of a quadratic function using a graphed quadratic model.

In algebra, a quadratic equation (from the Latin quadratus for "square") is any equation that can be rearranged in standard form as $ax^2+bx+c=0$ where x represents an unknown, and a , b , and c represent known numbers, where $a \neq 0$. If $a = 0$, then the equation is linear, not quadratic, as there

Quadratic Functions Unit. Well, my students and I have been in quadratic functions for quite a while now! Especially since our EOC testing fell in the middle of it all. I also feel like I did much better job this year with letting them explore/figure out the intricacies before we formalized in their notebooks.
