Abstract. The C++ language was created as an extension of C, which means that any program written in C is also a valid C++ program. However, experienced programmers typically make use of a set of high-level features made available exclusively in C++ as a way to control program complexity.

### C++ Programming Techniques in Finance | SpringerLink

Abstract. Financial code implemented in C++ uses programming libraries designed to simplify the creation of fast, standard-conformant classes. The best example of such libraries is the STL (standard template library) itself, a convenient library that is included with standard-compliant C++ compilers.

### Common Libraries for Financial Applications | SpringerLink

A very common activity in financial programming is the generation of price-related data that needs to be visualized by traders or other business stakeholders. Most of the time, the data is expected to be plotted in the form of a chart for easy visualization.
