The basic structure of the RC phase shift oscillator consist of 3rd-order cascaded RC filters and a negative-gain amplifier (-K). Oscillation occurs at the frequency where the total phase shift through the 3 RC circuits is  $180^\circ$ . The negative gain of the amplifier stage (-K) will add another  $180^\circ$  phase-shift. Resulting in a total phase-shift of  $360^\circ$  ...
