Select the documents as specified in the description of the 'Modified Apte' split. Prepare the data for mining and perform an exploratory data analysis (these steps will probably not be independent). The data mining task is to classify the texts according to the categories in the 'topics' field. You should compare at least 2 different classifiers.

Tuesday, May 5, 2020. Posted by Anton Tsitsulin, Research Intern and Bryan Perozzi, Senior Research Scientist, Graph Mining Team, Google Research. Understanding the differences and similarities between complex datasets is an interesting challenge that often arises when working with data. One way to formalize this question is to view each dataset as a graph, a mathematical model for how items relate to each other.

Google AI Blog: Understanding the Shape of Large-Scale Data

Data mining is a process of discovering patterns in large data sets involving methods at the intersection of machine learning, statistics, and database systems. Data mining is an interdisciplinary subfield of computer science and statistics with an overall goal to extract information from a data set and transform the information into a comprehensible structure for further use. Data mining is the analysis step of the "knowledge discovery in databases" process, or KDD. Aside from the raw analysis

To make sense of such a vast data resource, the ORNL team turned to process mining, which is the analysis of trends, patterns and details recorded by an information system. The team ultimately proved the technique could be used to make sense of immense databases such as the CDW.

In data analysis, anomaly detection (also outlier detection) is the identification of rare items, events or observations which raise suspicions by differing significantly from the majority of the data. Typically the anomalous items will translate to some kind of problem such as bank fraud, a structural defect, medical problems or errors in a text.. Anomalies are also referred to as outliers ...
